Field Record: SL-PADDY-SAMMANTHURAI

Sammanthurai, Ampara District. Dry Zone, irrigated. Cultivator M. I. Rasheed.

Document AV-FR-03 | Category: farm_record | Record current to 2 October 2026
Synthetic farm record for teaching. The fields are AgriVibe demonstration fields; cultivators, dates, observations and satellite values are invented and consistent with the AV-KB-001 thresholds.

Field details

Field id: SL-PADDY-SAMMANTHURAI
Location: Sammanthurai, Ampara District
Agro-ecological zone: Dry Zone
Water regime: Irrigated from a major scheme distributary
Cultivated extent: 2.0 hectares
Agrarian Service Centre: Sammanthurai
Cultivator: M. I. Rasheed

2026/27 Maha season

- 25 September 2026: first ploughing completed.
- 28 September 2026: drainage way on the southern side checked and found flowing.
- Planned: sowing Bg 94-1 (3½-month age class) on 12 October 2026, broadcast method.
- No Maha satellite observations are meaningful yet; the field is under land preparation.

2026 Yala season (completed)

- 2 May 2026: sowed Bg 94-1, broadcast.
- July 2026: growth in the south-east depression lagged the rest of the field while the field average stayed steady.
- 25 July 2026: after the depression dried, the cultivator noted a white crust on the soil surface there.
- 30 July 2026: the Agriculture Instructor visited, noted that the drainage way from the depression had been blocked, recorded symptoms consistent with salinity in that section, and advised restoring the drainage way.
- 18 August 2026: harvested. The drainage way was cleared the same week.

Table 1. Yala 2026 satellite observations

15-22 Jun 2026. Mean NDVI: 0.62; Std dev: 0.090; CV: 0.15; Uniformity: moderately_variable; Valid observations: 3; Data quality: moderate.
29 Jun-6 Jul 2026. Mean NDVI: 0.63; Change: +1.6%; Trend: stable; Std dev: 0.140; CV: 0.22; Uniformity: uneven; Valid observations: 4; Data quality: good.
13-20 Jul 2026. Mean NDVI: 0.64; Change: +1.6%; Trend: stable; Std dev: 0.150; CV: 0.23; Uniformity: uneven; Valid observations: 4; Data quality: good.

Cultivator notes

The south-east depression collects seepage from the neighbouring field. The cultivator intends to check the drainage way again before sowing and after the first heavy rain of the season.

The farmer organisation has proposed adopting improved alternate wetting and drying across the distributary this Maha. The cultivator has asked whether it suits this field.
