POLICY | DATA STANDARDS

Field Registration and Evidence Standards

What must be recorded for every registered field, the status of the thresholds the service uses, and the items that must be closed before use with real farmers.

Document AV-POL-03 | Category: policy | Rev 1.1, derived from AV-KB-001 Sections 1.3, 7.4 and 8
Teaching edition for the STEMLink AI Engineer Bootcamp. Content restructured from AgriVibe knowledge base AV-KB-001 Rev 1.1, which grounds its agronomy in Department of Agriculture and RRDI guidance for Sri Lanka. Not for use with real farmers until the verification items in AV-POL-03 are closed.

1. Field registration requirement

The field registry must record, for each field, the agro-ecological zone and whether the field is irrigated or rainfed. Both determine which fertiliser recommendation applies and which yellowing differentials are plausible (for example, iron toxicity is associated with Wet Zone and Intermediate Zone valley fields).

Without them the service cannot orient a farmer within the published schedule and must fall back to generic routing: the Agriculture Instructor, the 1920 service and the Grama Niladhari division recommendation.

2. Status of numeric thresholds

The NDVI change, uniformity and observation-count thresholds used by the satellite service are project demonstration thresholds defined for AgriVibe. They are not Department of Agriculture recommendations and not universal agronomic thresholds. Where official figures are reproduced, as in the fertiliser schedule, the source is cited and the distinction is stated explicitly.

Satellite measurements derive from Sentinel-2 imagery accessed through the Copernicus Data Space Ecosystem. The derived metrics (change percentage, trend, uniformity, valid observation count and data quality) are computed by the satellite service and are not supplied by the imagery provider.

3. Open verification items

Items to be closed before the service is used with real farmers. None blocks demonstration or bootcamp use.

Table 1. Open items

V1. Item: Fertiliser schedule accuracy; Status and action required: The four schedules in AV-CG-06 were checked against the DOA web tables on 3 October 2026; all season totals reconcile. The web tables do not mark columns, so they must still be checked against the official 2013 fertiliser recommendation booklet and the current GN division recommendation.; Owner: Agronomic reviewer.
V2. Item: Scope widening; Status and action required: Stating where a crop sits in the published schedule, as timing context, widens the original boundary and requires agronomic sign-off.; Owner: Agronomic reviewer.
V3. Item: Zone and water regime per field; Status and action required: Recorded for every field in the 2026/27 Maha registry (AV-FR-00). Keep it mandatory for new fields.; Owner: Engineering.
V4. Item: Additional schedules; Status and action required: Wet Zone and rainfed schedules added in AV-CG-06. Awaiting agronomic review before use with real farmers.; Owner: Agronomic reviewer.
V5. Item: Rainfall thresholds; Status and action required: The values that set heavy-rain flags are placeholders. Obtain agronomically defensible thresholds.; Owner: Agronomic reviewer.
V6. Item: District gaps in the irrigated IZ/DZ schedule; Status and action required: Ampara, Batticaloa and Vavuniya appear on the IZ/DZ rainfed list but not the irrigated list. Irrigated fields there (for example SL-PADDY-SAMMANTHURAI) are referred to the GN division recommendation until the booklet confirms which schedule applies.; Owner: Agronomic reviewer.

V7. Item: Time-sensitive policy documents; Status and action required: The subsidy (AV-POL-04) and guaranteed price (AV-POL-06) documents change every season. Review them when each season's Cabinet decision is announced.; Owner: Engineering.
